Task 03 - LeetCode Reverse String

Accepted submission screenshot (C#, Two Pointers, in-place):

Accepted - 477 / 477 test cases passed

Solution Explanation

I used the Two Pointers approach. One pointer starts at the beginning of the char array and the other starts at the end. While $left < right$, I swap the two characters, then move left forward and right backward until they meet. The array is modified in place, so no extra array is needed.

Time Complexity: $O(n)$ **Space Complexity:** $O(1)$

Submission summary: Calculator repository link, contribution link, and LeetCode solution proof.
